

Upon opening the app, the user is presented the option to have the app diagnose a problem, directly order a part, or find a local repair shop.

The diagnostic questionnaire includes questions about the type of device, what part of it is having a problem, and details of that problem. This serves to weed out easy fixes and prevent premature device replacements.

The diagnosis given has an overview of the problem, pros and cons of this diagnosis, and the recommended fix, which is usually ordering a part right within the app.

When a part is ordered, a package tracker is provided within the app, and instructions on how to use/install that part are readily available within the app for when it arrives.
